

CLAIMS

What is claimed is:

- 5 1. In a computerized device, a method for obtaining content from a content-originating device, the method comprising the steps of:
- identifying a location-path having a series of locations which leads from the computerized device to the content-originating device, wherein each location includes a set of devices, and wherein the set of devices of at least one location
- 10 includes multiple devices;
- selecting a device-path from the computerized device to the content-originating device based on the identified location-path, wherein the selected device-path includes at least one device of each location of the series of locations; and
- 15 acquiring the content from the content-originating device from at least one of the devices along the selected device-path.
2. The method of claim 1 wherein the content-originating device is configured to operate as a content server for a first host domain; wherein a tree data structure, which defines a content distribution layout having an inverted-tree shape, is
- 20 associated with a second host domain for distribution of content from the second host domain; and wherein the step of identifying the location-path includes the steps of:
- associating the tree data structure, which defines the content distribution
- 25 layout having the inverted-tree shape, with the first host domain; and
- ascertaining the location-path having the series of locations which leads from the computerized device to the content-originating device based on the tree data structure.

3. The method of claim 2 wherein the set of devices of each location along the series of locations which leads from the computerized device to the content-originating device provides multiple possible device-paths from the computerized device to the content-originating device, and wherein the step of selecting the device-path includes the step of:
- 5 choosing a device of each location to construct, as the device-path, a particular one of the multiple possible device-paths from the computerized device to the content-originating device.
- 10 4. The method of claim 1 wherein a location of the series of locations which leads from the computerized device to the content-originating device includes a set of devices that includes the computerized device and a tree former leader device, and wherein the step of identifying the location-path includes the steps of:
- 15 sending a location-path request message from the computerized device to the tree former leader device; and
- receiving, from the tree former leader device, a reply message which defines the location-path having the series of locations which leads from the computerized device to the content-originating device.
- 20 5. The method of claim 1 wherein a location of the series of locations which leads from the computerized device to the content-originating device includes a set of devices that includes the computerized device and a content fetching leader device, wherein the selected device-path includes the content fetching leader device, and wherein the step of acquiring the content includes the steps of:
- 25 sending a content request message from the computerized device to the content fetching leader device; and
- receiving, in response to the content request message, the content from the content fetching leader device.

2025 RELEASE UNDER E.O. 14176

6. The method of claim 1 wherein the step of selecting the device-path includes the steps of:

forming an ordered list of devices, wherein each device of the ordered list belongs to the series of locations which leads from the computerized device to the content-originating device; and

deriving the device-path based on the formed ordered list of devices.

7. The method of claim 6 wherein the content is a live feed, and wherein the step of deriving the device-path includes the steps of:

probing each device on the formed ordered list for responses; and
constructing the device-path based on the responses.

8. The method of claim 6 wherein the content is pre-positioned material, and wherein the step of deriving the device-path includes the steps of:

requesting the content from a first device in the formed ordered list; and
re-requesting the content from another device in the formed ordered list if the computerized device does not receive the content from the first device in the formed ordered list.

9. A computerized device for obtaining content from a content-originating device, comprising:

a network interface; and

a controller coupled to the network interface, the controller being

5 configured to:

- (i) identify a location-path having a series of locations which leads from the computerized device to the content-originating device, wherein each location includes a set of devices, and wherein the set of devices of at least one location includes multiple devices,
- 10 (ii) select a device-path from the computerized device to the content-originating device based on the identified location-path, wherein the selected device-path includes at least one device of each location of the series of locations, and
- 15 (iii) acquire the content from the content-originating device from at least one of the devices along the selected device-path through the network interface.
- 20

2025-01-01 10:00:00

10. The computerized device of claim 9 wherein the content-originating device is configured to operate as a content server for a first host domain; wherein a tree data structure, which defines a content distribution layout having an inverted-tree shape, is associated with a second host domain for distribution of content from the second host domain; and wherein the controller, in order to identify the location-path, is configured to:
- 5 associate the tree data structure, which defines the content distribution layout having the inverted-tree shape, with the first host domain; and
- ascertain the location-path having the series of locations which leads from the computerized device to the content-originating device based on the tree data structure.
- 10
11. The computerized device of claim 10 wherein the set of devices of each location along the series of locations which leads from the computerized device to the content-originating device provides multiple possible device-paths from the computerized device to the content-originating device, and wherein the controller, in order to select the device-path, is configured to:
- 15 choose a device of each location to construct, as the device-path, a particular one of the multiple possible device-paths from the computerized device to the content-originating device.
- 20

15. The computerized device of claim 14 wherein the content is a live feed, and wherein the controller, in order to derive the device-path, is configured to:

- probe each device on the formed ordered list for responses; and
- construct the device-path based on the responses.

5

16. The computerized device of claim 14 wherein the content is pre-positioned material, and wherein the controller, in order to derive the device-path, is configured to:

request the content from a first device in the formed ordered list; and

10

re-request the content from another device in the formed ordered list if the computerized device does not receive the content from the first device in the formed ordered list.

THE UNIVERSITY OF CHICAGO

17. A set of computerized devices for obtaining content from a content-originating device, comprising:

a first computerized device which is configured as a tree forming leader;

a second computerized device which is coupled to the first computerized

5 device, the second computerized device being configured to:

(i) obtain, from the first computerized device which is configured as a tree forming leader, a communications signal that identifies a location-path having a series of locations which leads from the second computerized device

10 to the content-originating device, wherein each location

includes a set of devices, and wherein the set of devices of at least one location includes multiple devices,

(ii) select a device-path from the second computerized device to the content-originating device based on the identified location-path, wherein the selected device-path includes at

15 least one device of each location of the series of locations, and

(iii) acquire the content from the content-originating device from at least one of the devices along the selected device-path.

20

18. The set of computerized devices of claim 17, further comprising:

a third computerized device coupled to the second computerized device;

wherein the third computerized device is configured as a content fetching leader;

25 and wherein the second computerized device, in order to acquire the content from the content-originating device, is configured to obtain the content through the third computerized device which is configured as the content fetching leader.

19. A set of computerized devices for obtaining content from a content-originating device, comprising:

a first computerized device which is configured as a content fetching leader;

5 a second computerized device which is coupled to the first computerized device, the second computerized device being configured to:

- 10
- (i) identify a location-path having a series of locations which leads from the second computerized device to the content-originating device, wherein each location includes a set of devices, and wherein the set of devices of at least one location includes multiple devices,
 - 15 (ii) select a device-path from the second computerized device to the content-originating device based on the identified location-path, wherein the selected device-path includes at least one device of each location of the series of locations, and
 - 20 (iii) acquire the content from the content-originating device through the first computerized device which is configured as the content fetching leader.

ИЗДАНИЕ

21. A computer program product that includes a computer readable medium having instructions stored thereon for directing a computerized to obtain content from a content-originating device, such that the instructions, when carried out by the computerized device, cause the computerized device to perform the steps of:
- 5 identifying a location-path having a series of locations which leads from the computerized device to the content-originating device, wherein each location includes a set of devices, and wherein the set of devices of at least one location includes multiple devices;
- 10 selecting a device-path from the computerized device to the content-originating device based on the identified location-path, wherein the selected device-path includes at least one device of each location of the series of locations; and
- acquiring the content from the content-originating device from at least one of the devices along the selected device-path.
